

Snitch Fashion Sales Analysis Project

Project report covering the data cleaning process in Excel and the final visualization in Power BI.

1. Dataset

- Started with the uncleaned Snitch Fashion sales dataset.
- The dataset contains sales, product, customer, date, city, segment, discount and profit-related fields.

2. Data Cleaning in Excel

- Checked missing, incorrect and inconsistent values.
- Cleaned numerical and categorical fields and corrected data types.
- Reviewed sales, units sold, discount, revenue and profit values for consistency.
- Prepared the cleaned dataset for analysis.

3. Data Validation

- Checked the cleaned data before importing it into Power BI.
- Verified important columns, dates, numeric values and key fields.
- Ensured the cleaned data was suitable for calculations and visualization.

4. Power BI Data Model

- Imported the cleaned data into Power BI.
- Organized the data using a fact table and supporting dimension tables.
- Created relationships between the sales data and dimensions such as product, date and city.

5. Measures and KPIs

- Created measures for Total Sales, Total Units Sold, Total Net Revenue, Total Profit, Unique Orders

and Profit Margin.

- Used these measures in KPI cards and other visuals so the report responds to filters.

6. Dashboard Pages and Visualizations

- Created a Home page for project introduction and navigation.
- Created an Executive Overview page with KPI cards, city sales, product-category sales, segment

sales and monthly sales trend.

- Created a Sales & Profit Analysis page with monthly revenue and profit, category comparison,

monthly units sold and discount versus profitability.

- Created a Product Performance page with product-level analysis, Top 5 Products by Sales and

Bottom 5 Products by Profit.

- Created a Geographic & Segment Analysis page with profit by city, city sales map, city-by-segment

matrix and segment sales.

- Created a Product Drill Through page for detailed product-level exploration.

7. Interactivity

- Added Year and Month slicers and applied slicer synchronization where required.
- Added page navigation buttons and bookmarks.
- Added filter controls and a drill-through page for detailed analysis.
- Added navigation back to the main report where required.

8. Report Design

- Used a consistent layout for KPI cards, charts, tables and navigation.
- Applied titles, labels, legends and formatting to improve readability.
- Used a consistent professional color theme across the report.

9. Final Outcome

- The final Power BI report provides an interactive view of Snitch Fashion sales performance.
- The dashboard can be used to compare sales, revenue, profit, products, cities, segments and monthly trends.

- The project demonstrates the complete flow from uncleaned data to cleaned data and interactive

business visualization.

Tools used: Microsoft Excel and Microsoft Power BI

Project flow: Uncleaned Dataset → Excel Data Cleaning → Data Validation → Power BI Data Model →

Measures → Visualizations → Interactive Dashboard
